

Apex Inventory

UI Requirement Specification

Add Stock

Route: /add-stock

Document Version: 1.0.0

Project: ReactExample (Apex Store Inventory Management)

1. Overview

The Add Stock page allows store staff to register incoming inventory. Users can add quantity to existing products or create new products. The page includes a session-based recent entries log for quick reference of additions made during the current browser session.

2. Purpose

- Record physical stock arrivals into the inventory system.
- Support both restocking existing items and introducing new products.
- Capture expiry dates and stock-in dates for traceability.
- Provide immediate feedback on successful additions.

3. Layout

- Left panel: Incoming Stock Form
- Right panel: Recently Logged Arrivals (session history, max 5 entries)

4. Form Fields

4.1 Stock Item Type (Segmented Control)

Visible only when existing items exist. Options: 'Existing Item' | 'New Product'. If no items exist, defaults to 'New Product' mode automatically.

4.2 Item Selection

- Existing mode: dropdown of all items showing name and current quantity.
- New mode: text input for product name (required).

4.3 Category

- Dropdown from categories API. Disabled (locked) when existing item selected.
- If no categories exist: red warning 'No categories found! Create one first.'

4.4 Quantity Received

Number input, minimum 1, default '10'. Must be positive integer.

4.5 Physical State

- Existing item: locked badge showing current state (solid/liquid).
- New item: segmented control to choose Solid Product or Liquid Product.

4.6 Expiry Date

Optional date picker. Helper text: 'Leave blank if no expiry'. Auto-filled from existing item when selected.

4.7 Stock-In Date

Required date picker. Defaults to today's date.

5. Form Submission Behavior

On submit (POST /api/items):

- Existing item with same name: backend merges quantity (adds to existing).
- New item name: creates new inventory record with default salesTrend and seasonalSales.
- Success: green banner for 4 seconds, entry added to recent log, form partially resets.
- New product mode: clears name and expiry after success.
- Existing mode: keeps selection, refreshes item list.

6. Validation Rules

- Existing mode: must have valid selected item ID.
- New mode: item name required (non-empty after trim).
- Category required.
- Quantity must be positive number.
- Alerts shown via browser alert() on validation failure.

7. Auto-Population on Item Select

When existing item is selected, category, physical state, and expiry date auto-populate from the selected item's current

values.

8. Recent Entries Panel

Client-side only (not persisted to server). Stores up to 5 most recent additions in session. Each entry shows: product name, logged date, quantity added (+N). Empty state: 'No recent stock added' with History icon.

9. Data Dependencies

- GET /api/categories - category dropdown
- GET /api/items - existing items list and post-submit refresh
- POST /api/items - add/merge stock

10. Technical Notes

- Component: src/pages/AddStock.tsx
